

Team Charter

Team Charter for Strong Data Gains LLC		
Purpose: To use this project to learn how to make a database, including the planning, design, and coding phases.	Goals: - Learn how to populate a database with user data - Create a real SQL database based on requirement gathering and brainstorming - Applying all of the lecture material to a real scenario	
Team Member Roles and Responsibilities		
Name & Email	Role	Task
Sebastian Ariza (sebastian.ariza87@login.cuny.edu)	Diagram to SQL Transition Lead	- Leads the conversion from E-R diagrams to logic diagrams - Leads the initiative of entering our database design into SQL
Julianna Rodriguez (julianna.rodriguez23@login.cuny.edu)	Team Coordinator and Requirement Gathering Lead	- Sends links for group meetings - Send reminders that we’re gonna meet - Requirements gathering lead
Mindiya Walisundara (mindiya.walisundara81@login.cuny.edu)	Data Lead	- Heads the E-R diagram design - Populating our gym goes data to use for our database
Christy Rosario (christy.rosario70@login.cuny.edu)	Report and Slides Lead	- Organizes the writing of our final report and presentation slides - Creates a list of goals to accomplish for our meetings
Team Rules		
Ground Rules: 1. Meetings will start within 5 minutes. 2. We will have goals for every meeting. 3. Everyone will collaborate, especially when a team member needs help with a task. 4. We’ll review our work before presenting it to the group. 5. We’ll complete our milestones on time, before the due date.		Communication Protocol: <i>Primary mode of communication:</i> WhatsApp for communication/planning and calls for live meetings. <i>Frequency of communication:</i> Everyone commits to checking WhatsApp on a regular basis. Live meetings will be about once a week. <i>Response time:</i> No longer than one day.

	<i>Who is the primary communication coordinator?</i> Julianna will send reminders to the group about meetings and deadlines. <i>Who will communicate what to whom</i> Everyone is responsible for communicating, it's a small group it's up to everyone. Communicating with the professor can be done by any member, we'll CC each other so everybody is in the loop.
--	--

Meeting Notes

Time/Date/ Location	Attendees	Topic	Meeting Notes
9/29 5:20pm After class	Christy Sebastian Julianna	Number exchange	- Formed a WhatsApp group to go over logistics etc. - Going to plan a meeting to brainstorm ideas and start the project proposal
10/1 5:00pm After class	Mindiya Sebastian Julianna	Topic Brainstorm	- Read through the proposal deliverables at the end of class - Briefly brainstormed some ideas to discuss at our first Zoom meeting - Came up with a date/time to meet for at least an hour to prepare our proposal
10/5 6:00pm- 8:00pm Zoom call	Mindiya Sebastian Julianna Christy	Project Proposal	- Created roles and delegated who is going to lead each section of our project's deadlines - Completed the Team Charter - Fully expanded on our project idea into a proposal and the five questions our scope looks to cover
10/6 4:00pm Before class	Mindiya Sebastian Julianna Christy	Project Proposal Q&A with Prof	- Asked if we were on the right track for the proposal - Finalized edits before submitting

Project Proposal

Project Members: Christy Rosario, Mindiya Walisundara, Sebastian Ariza, and Julianna Rodriguez.

Class: CIS 3400 with Professor Javalý

Project Selection: Luxury Gym in Manhattan

Brief Overview of Project:

Our team has decided to create a database for a luxury gym in Midtown Manhattan. The gym that we're working with has a few luxury amenities including a sauna, a cold plunge, and exercises classes all of which members need to schedule to use. We first collect data from members during the enrollment process and give the member a unique ID card that also lets them access the gym's proprietary app. Then, we collect data when members tap their ID to enter the gym and when they use the app to make amenity reservations such as scheduling classes. Our gym has different membership tiers and lengths. A member can get a monthly or yearly membership that is either month to month or is on an annual contract. Members can also get a premium membership that includes all luxury amenities at no extra charge, or a normal membership where they can pay for the amenities on a use case basis. The gym also has a free trial program that allows new members to get a day pass with the option to buy into a membership plan.

With the different membership options and services offered by the gym, our database will help organize and connect all of this information. The database will keep track of members, their membership plans, gym visits, and reservations for amenities and exercise classes. This will allow the gym to see how members are actually using their memberships, including how often they visit and which amenities or classes they use the most. By keeping this information together, gym management can better understand which membership plans and services are the most popular among members.

From the information that our database collects and maintains, gym management can learn more about how members use the gym and its services. Management will be able to break down the gym's usage into various categories, allowing them to have the ability to see trends amongst the data. For example, they can analyze the data to compare different membership plans and see which ones are the most popular. Similarly, they can learn about retention rates and determine how many members continue their membership after a free trial or first month. This gives management a better understanding of member activity and preferences.

Overall, this information can help the gym make better decisions about its services and daily operations. Having the data to know which days and times are the busiest can help

management adjust operating hours and employee schedules. Information about class and amenity attendance can help determine which services should be offered more often or given more availability. The gym can also use membership data to improve its membership options based on which plans members use and prefer the most.

The Five Questions:

1. How does peak gym usage break down?
 - a. What days have the highest number of member visits?
 - b. What times have the highest number of member visits?
 - c. How many members are there in the gym and what is the average, median and mode for age?
 - d. How many people use each type of membership?
2. Which amenities and classes have the highest attendance?
 - a. What percentage of the attendance came from premium members?
 - b. What percentage came from basic members paying for individual classes on top of their basic membership?
 - c. Which classes are the most attended?
 - d. Are there trends relating to who attends which amenities?
3. What do member retention rates look like after a free trial or first month?
 - a. How does the free trial program affect membership retention?
 - b. Does a free trial correlate to a member staying for longer?
4. Which membership plans are used most frequently by members?
 - a. Is there a pattern as to which types of members pay for premium memberships?
 - b. Which group prefers the basic membership?
 - c. Do contract or non-contract members stay at the gym for longer?
5. How does gym usage break down by different categories?
 - a. What age groups use the gym most regularly?
 - b. Which age group has the most gym memberships?
 - c. What are peak hours per age group?
 - d. Does the time of day a member goes affect which amenities they use?

The objective of these five questions is to define the scope of how we are going to help the gym understand the data collected from its membership ID and app usage. Membership records will help us collect information about the gym's usage to then organize in our database. Together, this data can help gym management better understand member behavior and confidently make ongoing decisions about their memberships, operating hours, classes, and amenities.
